UX

Testing

For testing we hardcoded the credentials needed to login.

Username: test

Password: 123

Wireframe

Drawio-File can be found in the zip.

Personas

The “Personas” we have, that can interact with the system are:

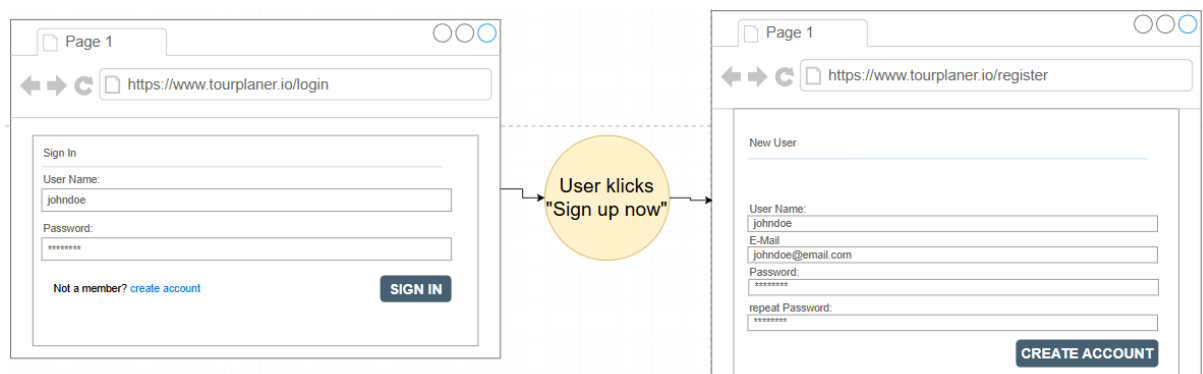

Visitor – a Visitor has no account.

User – a User has an account.

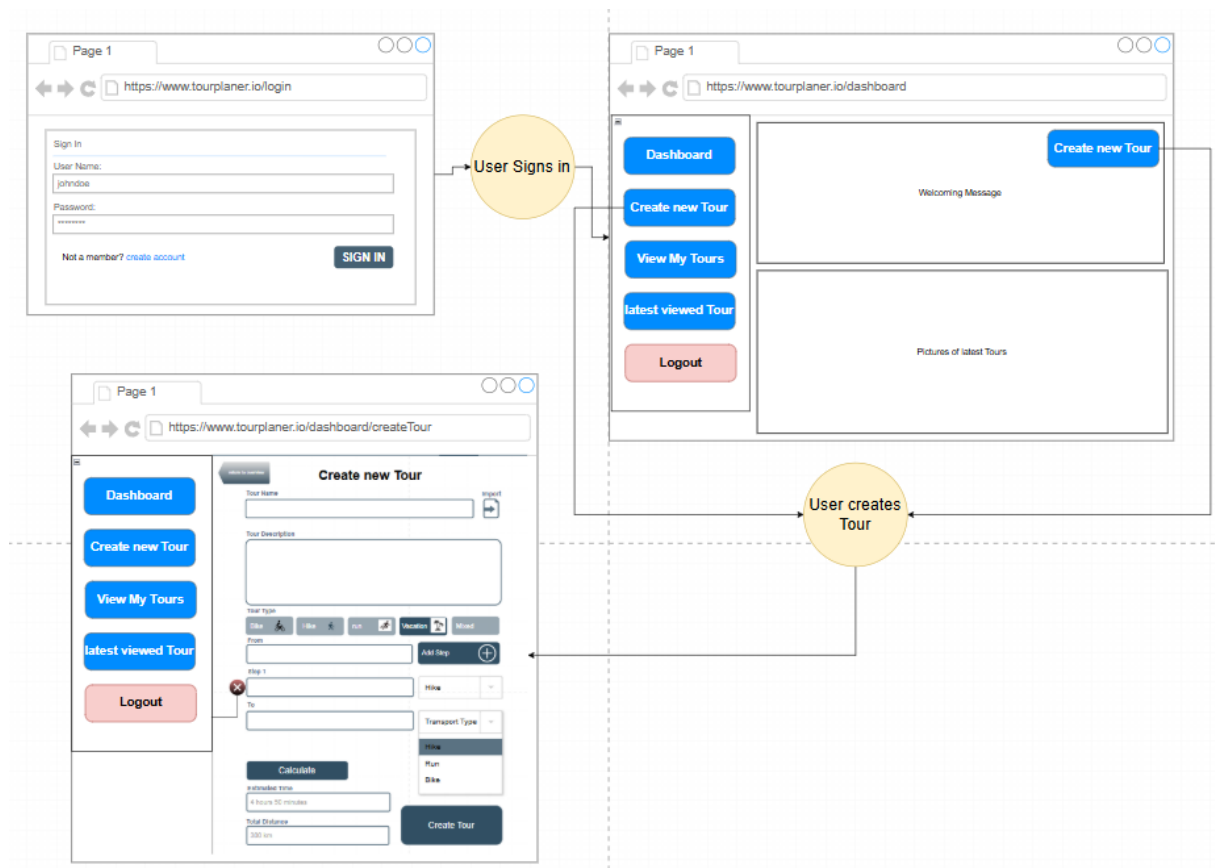

Scenarios:

the wireframes in the documentation are not supposed to show the actual design, which has been improved since the creation of the Wireframe, but instead represent the flow of the scenarios

“As a visitor I want to register an account, so that I can log in”

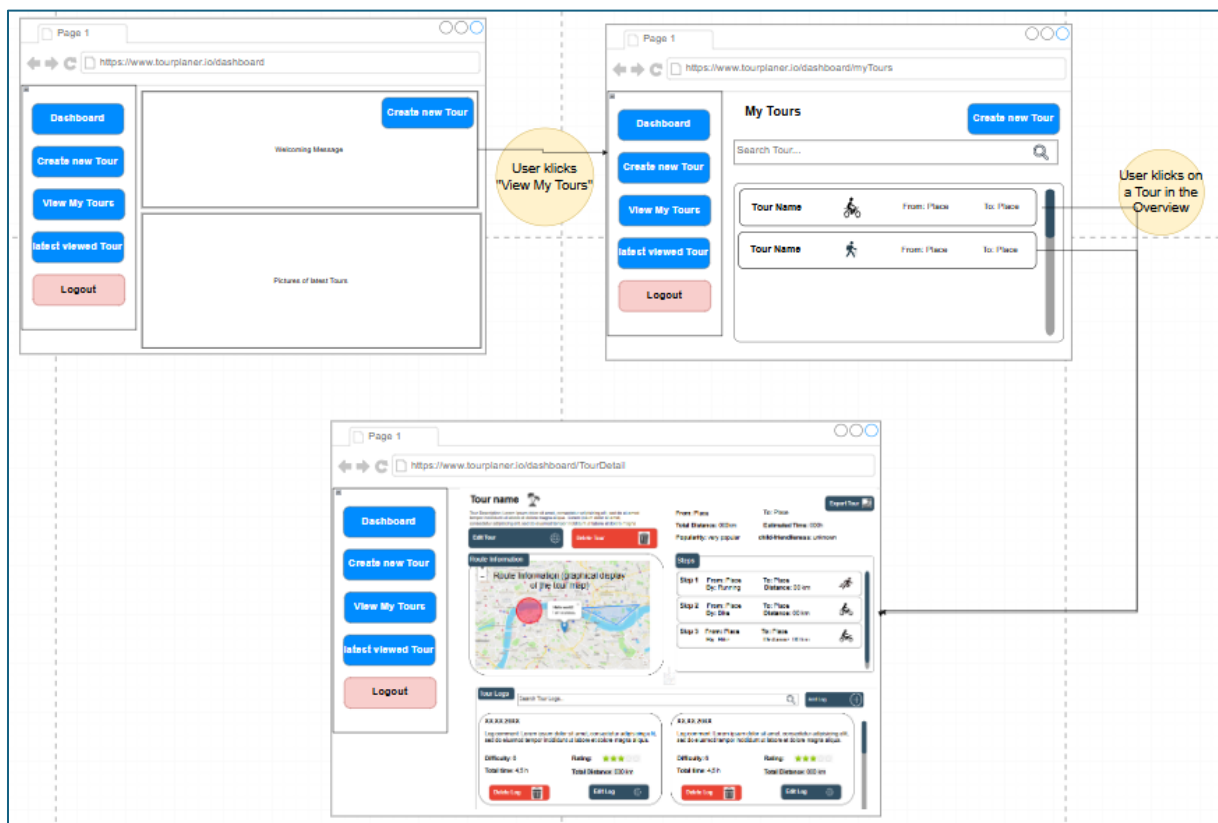

“As a User I want to login, so that I can create a Tour”

Since “Creating a Tour” is one of the main Use-Cases of our Tour-Planner we gave the User multiple options to reach that screen.

However we also did not want to just throw the user into a functionality, once they are logged in, which is why we have the dashboard-screen.

“As a User I want to view a specific Tour, so that I can easily manage it”

From the Dashboard the user has the option to see an overview of their tours.

From the Overview the user can select a Tour by clicking on it and is navigated to the overview, where they are given the Option to “Modify” or “Delete” the Tour

As well as add or delete Logs.

The tour that was the last one to be selected by the user is saved in the App-State. This way the User also has the easy option to navigate to this tour by clicking “latest viewed Tour”. Creating a Tour saves that one to the App-State as the latest selected and navigates to the detail-screen.

Improving User-Experience

List-Containers Scrollable/Collapsible

A Decision that was made to improve the User-Experience was to make the List-Containers:

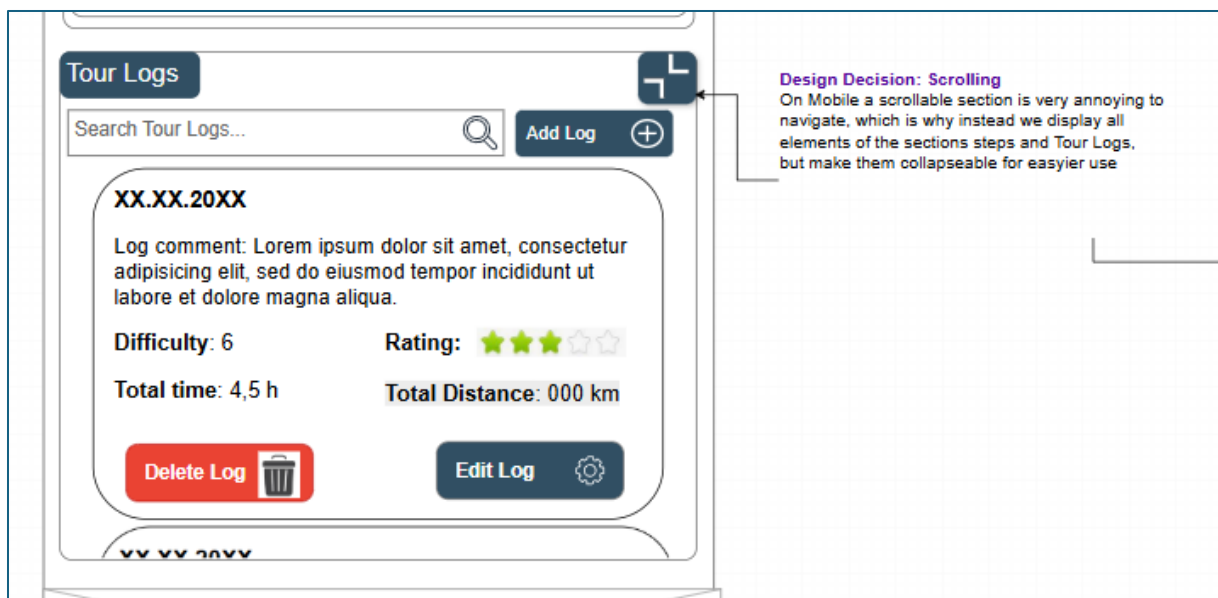

- Steps in Detail-Screen
- Logs in Detail-Screen

Scrollable when the User is using a desktop (large Screen)

And collapsible, when the User is using a small device.

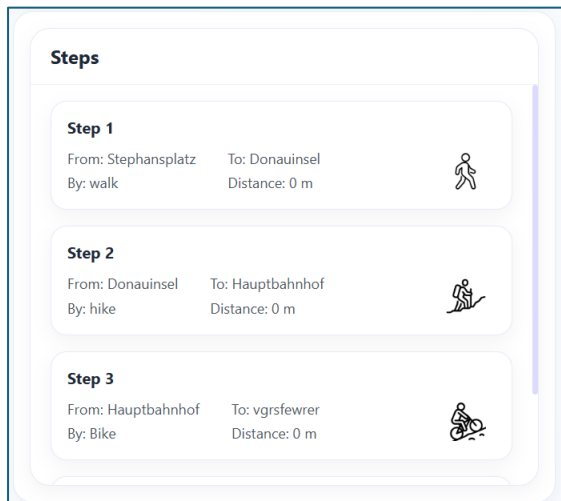

This makes it easier to navigate for the user.

This had been the plan on the original wireframe:

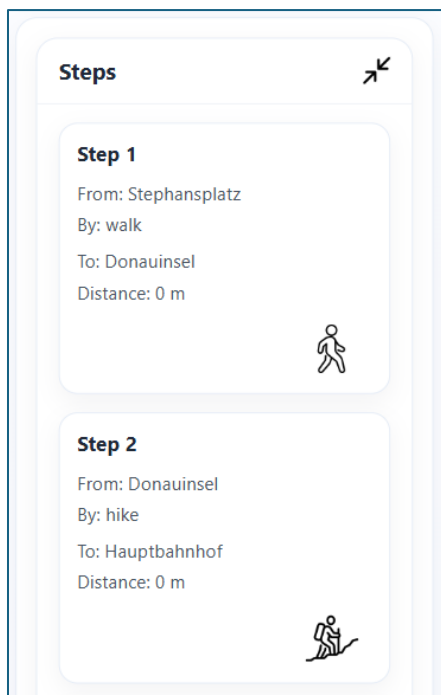

And has been implemented like this:

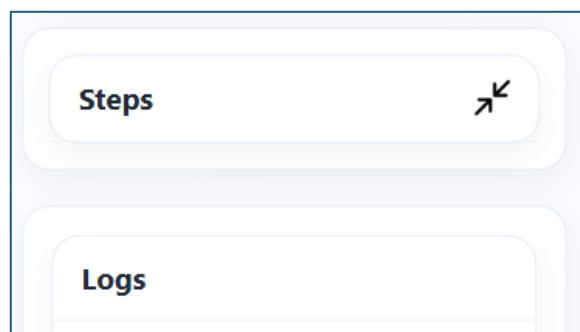

Steps on Desktop:

Steps on Mobile – not collapsed:

Steps on Mobile – collapsed:

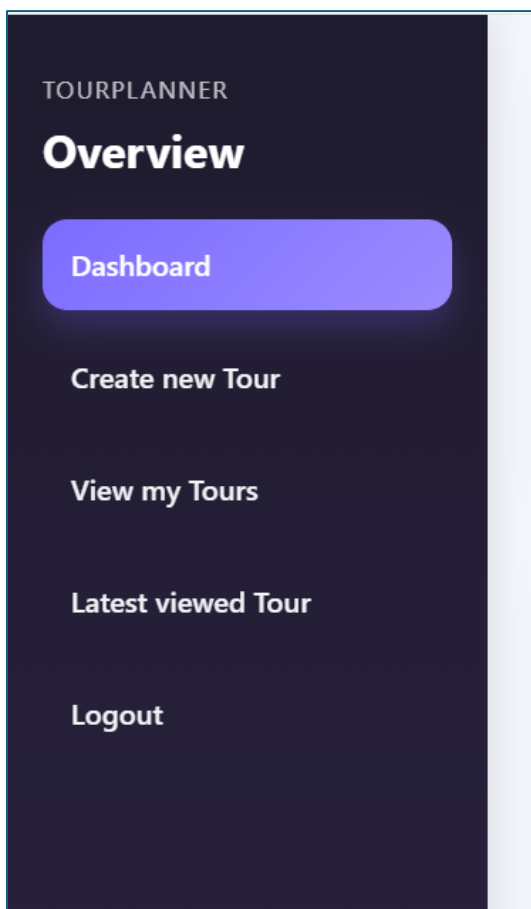

Navigation

Something we changed in our design was the way the user navigates the website. While in the original wireframe then user would navigate by using a top-nav-bar:

In the actual implementation we decided to use a side-nav-bar instead, to give it a more modern look:

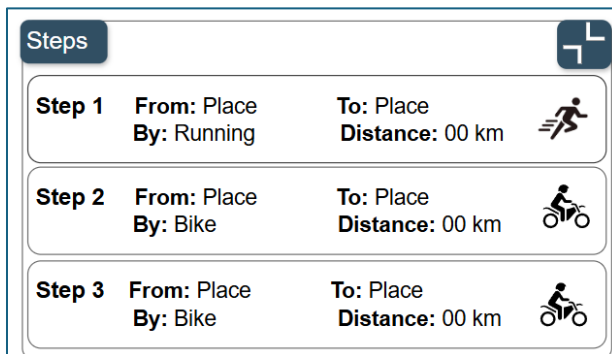

Icons

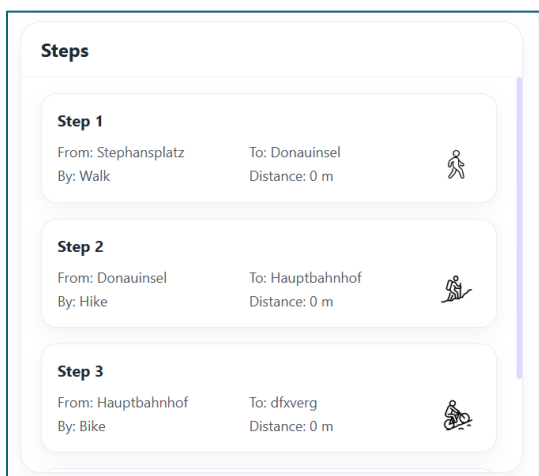

We decided to use intuitive icons to make it easy for the user to navigate/get information.

For Example in the steps we are displaying the route-type (the transport-mode by which the step is taken) by using icons.

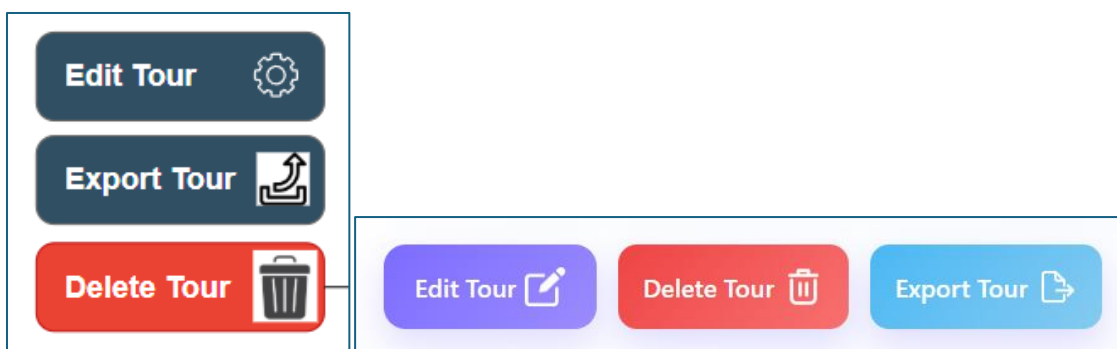

Wireframe:

Implementation:

Another Example for this are the Buttons:

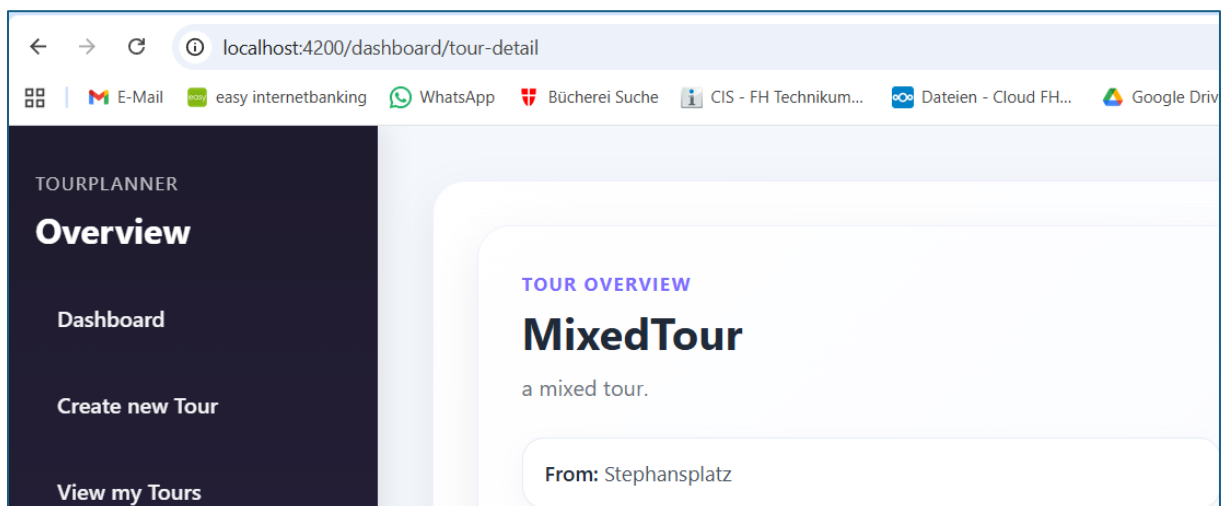

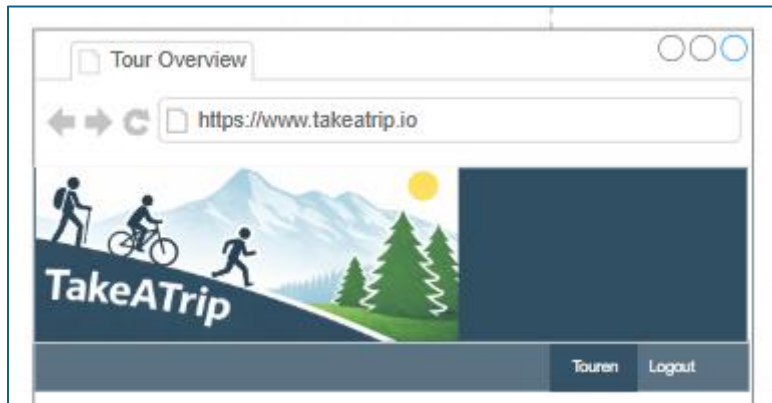

Wireframe

implementation

Here we also decided to use 3 different colors to make the distinction easier.

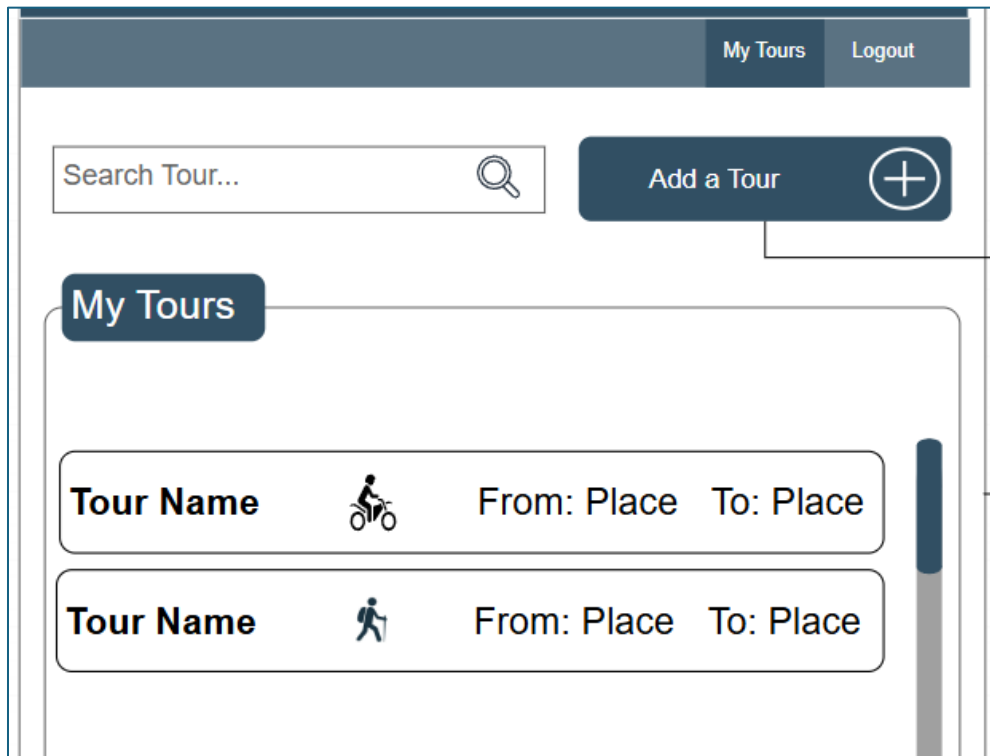

Banner

While in the wireframe a Banner was used, we decided against it in the implementation to freshen up the look of the website.

Maps in Tour Overview

In the wireframe we did not have a “picture” aka map on the tour overview:

However, since this was a requirement for the intermediate hand-in we added them:
